

Install Guide

Version(s) >= 1.1.0

Introduction

As of version 1.1.0 you will have only one installation of ColdBox per web server. The *src* directory will not exist anymore in the package, instead the system folder will be there. Please look below for a structure of the bundle you download.

See Milestone: [1.1.0](#)

Start

Once you download the [ColdBox](#) distribution bundle you can place the it on your web server root:

- **{Web_Root}/coldbox/system**

You will have the following once the archive is expanded:

```
| coldbox
| ---+ ApplicationTemplate
| ---+ install
| ---+ samples
| ---+ system
```

You can now point your browser to the *samples* directory to view the samples gallery or look at the *ApplicationTemplate* folder to start a new application. The install folder contains several instructions and more documentation. The main documentation for the framework is this wiki.

Note: For production servers, please leave only the **system** folder. You can remove the rest of the directories if needed.

Version(s) < 1.0.2

Introduction

For version(s) < 1.0.2 you will need to place the ColdBox system folder (*with or without the Dashboard*) in every application you develop.

Why would I want to do this?

Well, the need to have separation was needed in most of my design requirements per application. That way, when I update a ColdBox system folder, then only one application that I update can be tested, regressed and modified accordingly. This installation method will be deprecated as of version 1.1.0 where you will have one installation per web server.

Start

Once you download the [ColdBox](#) distribution bundle you will have the following once the archive is

Install Guide
Version(s) >= 1.1.0
Introduction
Start
Version(s) < 1.0.2
Introduction
Start
ApplicationTemplate
install
samples
src

expanded:

```
| coldbox  
|---+ ApplicationTemplate  
|---+ install  
|---+ samples  
|---+ src  
|--- system
```

ApplicationTemplate

A sample application template. You can copy and use the [My First Application Guide](#) to create a new application.

install

This folder contains the readme.txt, license.txt, powerby logos, guides and documentation.

samples

The [ColdBox](#) samples gallery. In order to make the samples gallery functional you will need to do the following:

1. Copy the samples folder to your CFMX server.
2. Create a CFMX mapping to the samples folder path you just copied to the CFMX server called "coldboxSamples".
3. Browse to the samples directory on your browser and that is it.

src

It holds the ColdBox system folder. You can place this in any application you are going to start developing. It contains the full source code of both the framework and the Dashboard.
